## **DETAILED ACTION**

### ***Specification***

1. Applicant is reminded of the proper language and format for an abstract of the disclosure.

The abstract should be in narrative form and generally limited to a single paragraph on a separate sheet within the range of 50 to 150 words. It is important that the abstract not exceed 150 words in length since the space provided for the abstract on the computer tape used by the printer is limited. The form and legal phraseology often used in patent claims, such as "means" and "said," should be avoided. The abstract should describe the disclosure sufficiently to assist readers in deciding whether there is a need for consulting the full patent text for details.

The language should be clear and concise and should not repeat information given in the title. It should avoid using phrases which can be implied, such as, "The disclosure concerns," "The disclosure defined by this invention," "The disclosure describes," etc.

### ***Claim Rejections - 35 USC § 103***

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sivan (U.S. Pat. No. 6,757,701) in view of Jin (U.S. Pat. No. 6,999,531).

As to claim 1, Sivan (figs. 2-4) shows a method of implementing internal signals for use in a MAP algorithm, including the steps of: obtaining first decoding signals by processing received systematic and received encoded symbols of each symbol sequence of a received signal (col. 2, lines 65 through col. 3 line 11); obtaining second decoding signals for the current symbol sequence by processing the first decoding signals of the previous sequence and second decoding signals of the previous sequence (figs. 2-3; col. 3, lines 12-20); obtaining third decoding signals

Art Unit: 2133

for the current symbol sequence by processing the first decoding signals of the current sequence and third decoding signals of the next sequence; normalizing the second and third decoding signals (figs. 2-3; col. 4, lines 28-67).

Sivan differs from claim 1 in that he does not explicitly disclose the second and third decoding signals of the previous and next sequence are un-normalized. However, the limitations are obvious and well known in the art, as evidenced by Jin (col. 5, lines 45-67).

Therefore, it would have been obvious to a person of ordinary skill in the art, at the time of the invention, to improve upon the soft-decision decoding device, as disclosed by Jin. Doing so would increase the speed and precision of the turbo decoder while better utilizing the dynamic range, lowering the gate count and minimizing memory requirements.

***Allowable Subject Matter***

4. Claims 2-16 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

***Conclusion***

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. See PTO-892
